

## **Fast Fourier Transforms and Frequency Visualisation of Audio Files - Requirements**

A discrete Fourier transform (DST) is a mathematical method for breaking any waveform into its component sinusoidal parts. That is to say, all waveforms are really just sums of sinusoids. The Fast Fourier Transform (FFT) is a computer algorithm that can perform a DST very quickly, thus making DSTs more useful in computing where things are typically expected to go more quickly.

Using FFT, one can isolate the component frequencies of a sound for instance. This is useful for the analysis of audio, and in particular, visualisation of audio by plotting the component frequencies on a graph, or by performing the visualisation in some other manner using a graphics library such as OpenGL.

For this project to be successful, I will need to be able open and read meaningful data from the PCM packets found in the uncompressed wave audio, and apply a Fourier transform to get the component sine waves of the recorded waveforms. From there, a graph of the frequencies can be produced using OpenGL, as the program collects the relevant data in real time.

This project will most likely consist of three major parts:

- Playing and parsing the audio files
- the FFT implementation
- visualisation with OpenGL

### **Approximate Schedule:**

May 4 – May 8	Finish planning	<ul style="list-style-type: none"><li>• Planning and requirements document</li><li>• Design document</li><li>• Finish initial research</li></ul>
May 9 – May 15	Open and play WAV files	<ul style="list-style-type: none"><li>• Get file name from user</li><li>• Open file safely</li><li>• Read from file</li><li>• Play file</li></ul>
May 16 – May 22	Read data from PCM packets	<ul style="list-style-type: none"><li>• Get meaningful data from PCM packets</li><li>• Determine what data is required for FFT</li><li>• Figure out how to process the data</li></ul>
May 23 – May 29	Decide on an implementation of FFT	<ul style="list-style-type: none"><li>• There are many FFT algorithms and approaches for its implementation</li><li>• Pick one and begin implementing it</li></ul>
May 30 – June 5	Work on FFT implementation	<ul style="list-style-type: none"><li>• Try to finish the FFT part of the project</li></ul>
June 6 – June 12	Learn OpenGL	<ul style="list-style-type: none"><li>• Experiment with and learn how to use OpenGL to visually represent data</li></ul>

June 12 – June 19	Final push	<ul style="list-style-type: none"><li>• Add OpenGL visualisation to the project</li><li>• Do lots of testing and debugging</li><li>• Finish documentation: post-mortem document, testing document</li></ul>
-------------------	------------	---
